Remote Coolant Discharge System

Copyright 2001 by Air Options, Inc.

For some applications, access to a drain may not be possible. Locations such as a basement or in the center of the plant. In some cases it may not be desirable to route the drain to a parking lot or yard. In these cases a simple sump pump arrangement can be configured and the coolant discharge can be routed over head and to the nearest convenient drain.

The sump can be an ordinary 5 gallon food service bucket. A small sump pump should be selected with a level switch. Small sump pumps usually have a garden hose fittings for their output which makes it very easy to route the drain line.

The illustration below is intended as a general guide for this installation.
